

Interpretations of VP anaphora through reference to salient events

Kanan Luce (University of California, Berkeley)

Jeffrey Geiger (University of Chicago)

Christopher Kennedy (University of Chicago)

Ming Xiang (University of Chicago)

Overview

- Verb Phrase Ellipsis:
 - “I’m going to add a cup of sugar to my tea”
“I wouldn’t ”
 - “Do that” Verb Phrase Anaphora:
 - “I’m going to add a cup of sugar to my tea”
 - “I wouldn’t **do that**”
-

Overview

- Verb phrase ellipsis (VPE) interpretations are sensitive to nonlinguistic manipulations under certain conditions (Geiger & Xiang 2017)
 - What is the relationship between nonlinguistic (contextual) and linguistic (antecedent) information in determining VPE interpretations?
-

Overview

- New experiment examining role of nonlinguistic context in determining interpretations of verbal anaphor “do that” and comparison to VPE
 - Results: Both VPE and “do that” are sensitive to nonlinguistic contextual manipulations, but the role of context is much more restricted for VPE
-

Background

- Traditionally, Verb Phrase Ellipsis (VPE) is thought to be resolved mainly through identity with an overt linguistic antecedent. (Hankamer & Sag, 1976; Fiengo & May, 1994; Merchant, 2001, 2004, i.a.)

Linguistic Antecedent

- Hankamer: I'm going to **stuff this ball through this hoop**.
- Sag: It's not clear that you'll be able to _____.

Non-Linguistic Context

- [Hankamer attempts to **stuff a 9-inch ball through a 6-inch hoop**]
 - #Sag: It's not clear that you'll be able to _____.
-

Background

- The possibility of exophoric (antecedent-less) VPE under certain conditions calls this into question. (Miller & Pullum, 2013)
 - Ex: [a child pulling her mother through a store aisle toward a rack of DVDs]:
“Can we __? Can we __?”
-

Background

- Two possible explanations:
 - VPE can freely be resolved to any salient discourse item (linguistic or non-linguistic). Linguistic antecedents are much more likely than non-linguistic contexts to fulfill the requirements for resolution. (Miller & Pullum, 2013)
 - VPE cannot be resolved with respect to a nonlinguistic event. Exophoric VPE is “defective”, and requires resolution through other means. (Merchant, 2004)
-

Background

- Geiger & Xiang (2017) looked at the interpretation of VPE when the interpretation supported by the antecedent and the non-linguistic context competed.
 - Results: Salient contextual information not present in the antecedent can be considered, but antecedent-identical interpretations are always preferred.
-

Background

- Verb Phrase Anaphora (VPA) such as “do it/this/that” is often contrasted with VPE, as these expressions *can* be resolved with respect to a non-linguistic context. (Hankamer & Sag, 1976)

Linguistic Antecedent

- Hankamer: I’m going to **stuff this ball through this hoop**.
- Sag: It’s not clear that you’ll be able to **do it**.

Non-Linguistic Context

- [Hankamer attempts to **stuff a 9-inch ball through a 6-inch hoop**]
 - Sag: It’s not clear that you’ll be able to **do it**.
-

Background

- This recalls the resolution of the demonstratives “this” and “that”, which can felicitously be used to refer to highly salient discourse entities. (Gundel et al., 1993)
-

Question

- What interpretations of VPA are available given competing linguistic and non-linguistic contexts?
 - VPA may be resolved through reference to a salient discourse event.
 - Comparison to VPE should reveal whether VPE can freely be interpreted with respect to linguistic *and* nonlinguistic discourse events.
-

Experiment

- Judgment Task using Amazon Mechanical Turk
 - Subjects were asked to rate a possible VPA interpretation based on non-linguistic and linguistic contexts
 - Mirrors design of Geiger & Xiang (2017), replacing VPE with VPA
-

At the grocery store

← Non-Linguistic Context

Son: I want to buy candy bars! ← Linguistic Antecedent

Father: We can't do that.

On a scale of 1 to 7, where 1 is the least likely and 7 is the most likely, how likely do you think it is that the father meant:

We can't buy five candy bars today, but maybe we could get fewer. ← Interpretation

(Unlikely) (Likely)

Use number keys or click boxes to answer.

Experiment

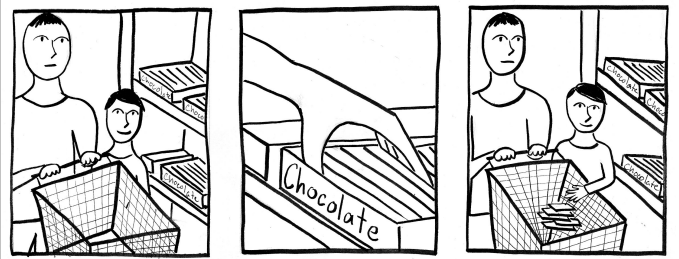

Experiment

Experiment

Context Type (3)	Antecedent Type (3)	Response	Interpretations (2)
<p>Unavailable Context-</p> 	<p>No Antecedent-</p> <p>[No Antecedent]</p>		<p>Unmodified Interpretation-</p> <p>On a scale from 1 to 7, where 1 is the least likely and 7 is the most likely, how likely do you think it is that the father meant:</p>
<p>Available Context-</p> 	<p>Unmodified Antecedent-</p> <p>Child: "I want to buy candy bars!"</p>	<p>Father: "We can't do that."</p>	<p>We can't buy any candy bars today.</p>
<p>Salient Context-</p> 	<p>Modified Antecedent-</p> <p>Child: "I want to buy five candy bars!"</p>		<p>Modified Interpretation-</p> <p>... :</p> <p>We can't buy five candy bars, but maybe we could buy fewer.</p>

Experiment

- Each scenario had 18 variations (3 Context x 3 Antecedent x 2 Interpretation)
 - 6 different scenarios, with 10 fillers
 - Participants: 89 subjects, all native English speakers, recruited through Amazon Mechanical Turk, \$1.50 compensation, aged between 18 and 49 (mean: 29)
-

Predictions

- Hypothesis 1: VPE and VPA equally sensitive to nonlinguistic context
 - Antecedent-identical interpretation always dominant
 - Interpretation matching non-linguistic context is weaker
 - VPA results = VPE results
 - Consistent with Miller & Pullum (2013)
-

Predictions

- Hypothesis 2: Role of context for VPE is more restricted than VPA
 - Context-supported interpretation relatively stronger for VPA than for VPE
 - Antecedent-identical interpretation might be subsumed by context-supported interpretation
 - VPA results \neq VPE results
 - Consistent with Hankamer & Sag (1976), Merchant (2004)
-

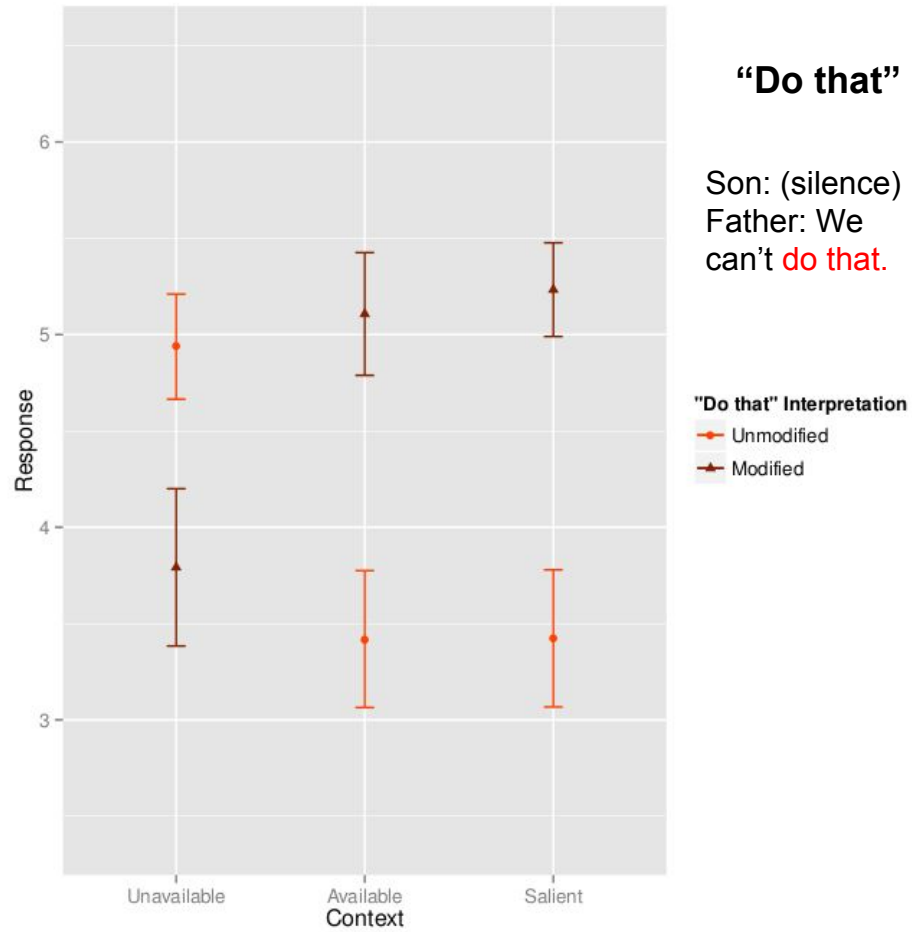

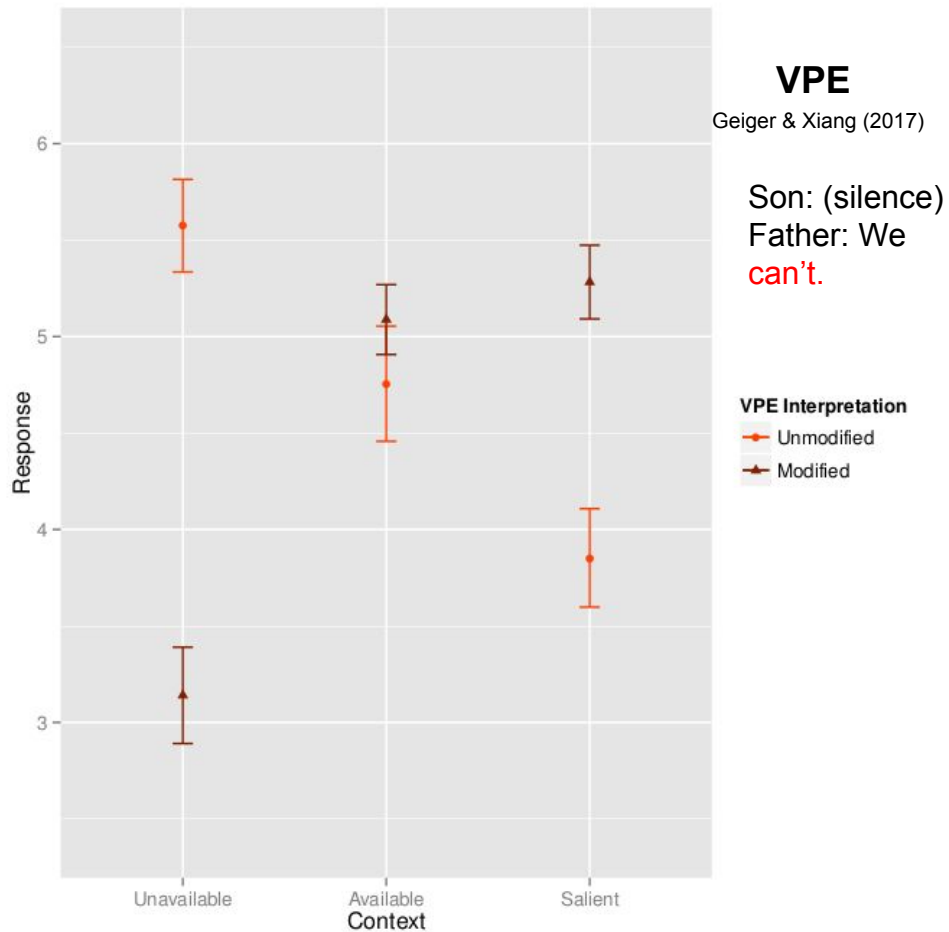

Results

- The overall mixed-effect model showed a significant three-way interaction between Non-linguistic Context, Antecedent, and Interpretation ($p < .01$)
 - Separate analyses were done by antecedent type
-

Results - No Antecedent

Results - No Antecedent

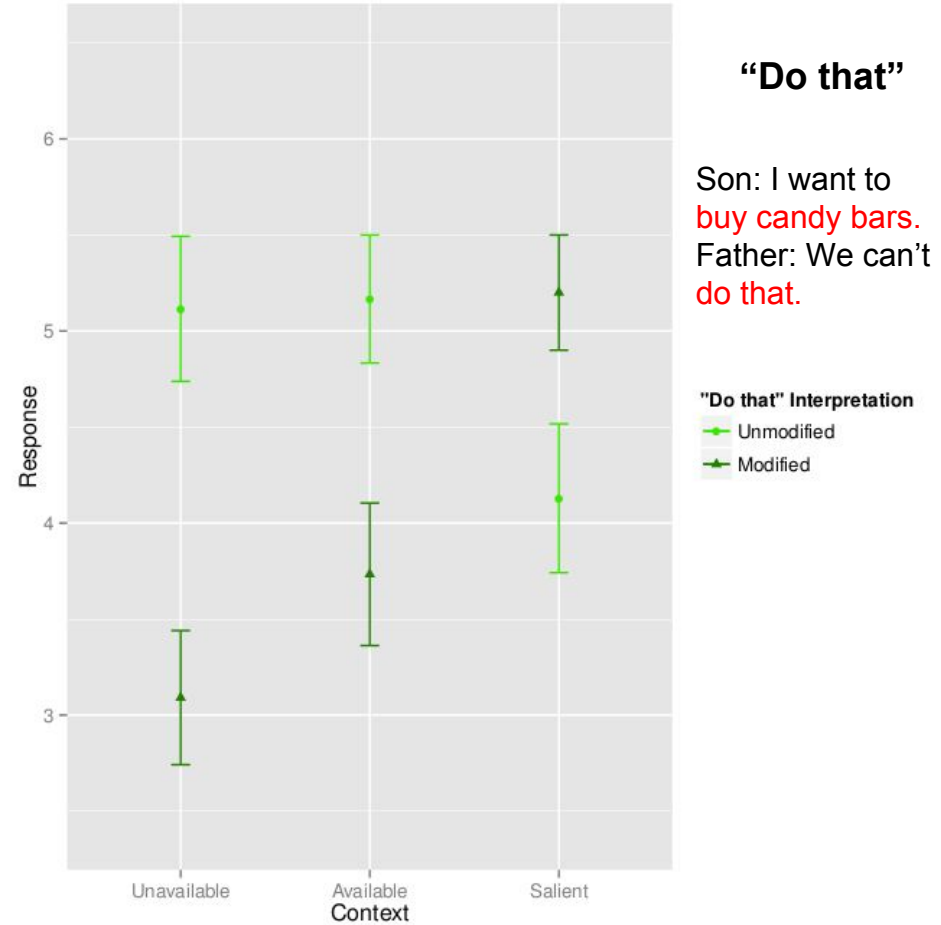

Results - No Antecedent

Results - No Antecedent

- For VPE, the Unmodified and Modified Interpretations are similar in the Available Context
 - For VPA, the Unmodified Interpretation is dispreferred in the Available Context
 - The contextually salient event (in this case favoring the Modified Interpretation) is more accessible for VPA than VPE
-

Results - Unmodified Antecedent

Results - Unmodified Antecedent

Results - Unmodified Antecedent

VPE

Geiger & Xiang (2017)

Son: I want to buy candy bars.
Father: We can't.

VPE Interpretation

- Unmodified
- Modified

"Do that"

Son: I want to buy candy bars.
Father: We can't do that.

"Do that" Interpretation

- Unmodified
- Modified

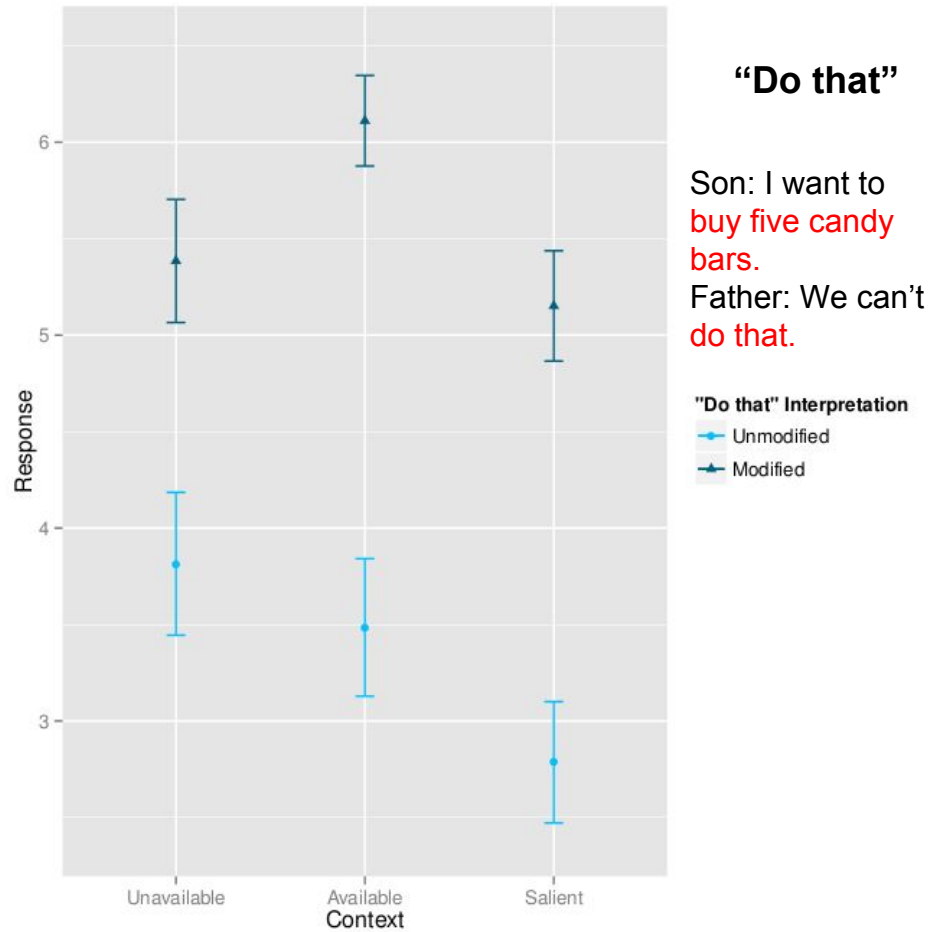

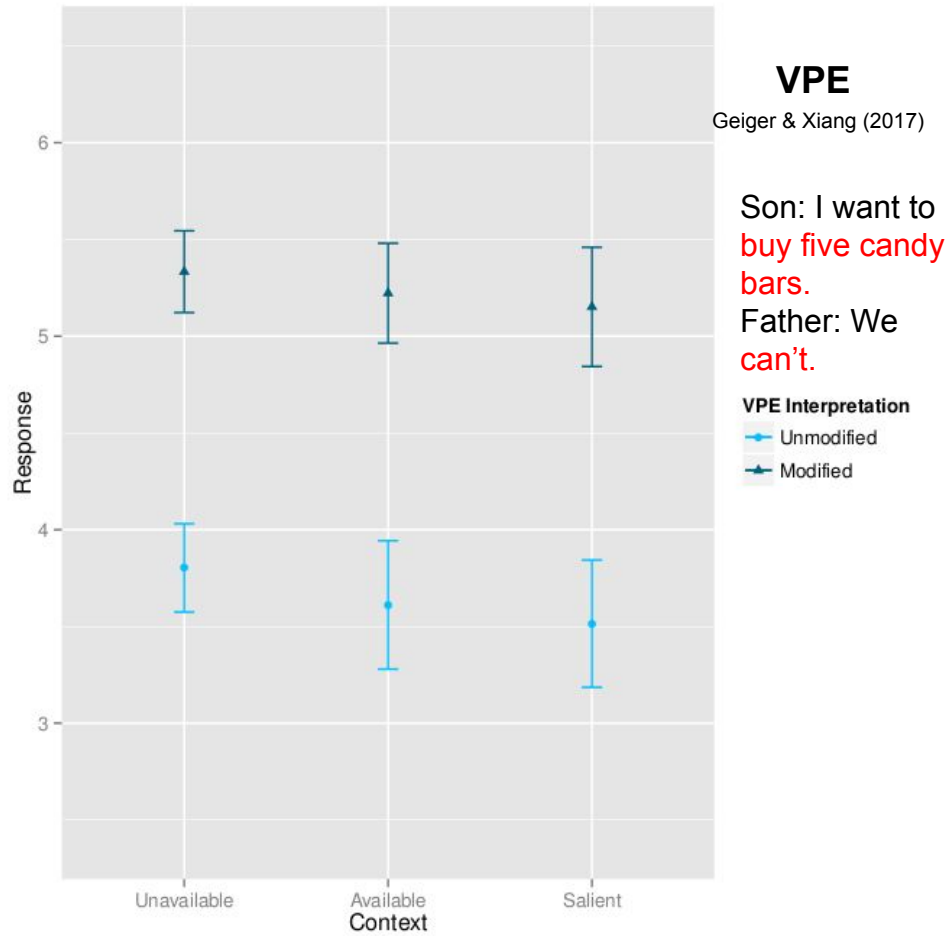

Results - Unmodified Antecedent

- For VPA, the most salient non-linguistic context preferred over the conflicting unmodified antecedent
 - VPE is more strongly constrained by an identical linguistic antecedent
-

Results - Modified Antecedent

Results - Modified Antecedent

Results - Modified Antecedent

- For both VPA and VPE, the interpretation is dominated by the inclusion of the numeral in the antecedent
 - No substantial effect of context
-

Conclusion

- Both VPE and VPA can be resolved by a salient non-linguistic context
 - The results for VPA in the No Antecedent and Unmodified Antecedent conditions show key differences from VPE which suggest that while VPA can be resolved through reference to a salient (linguistic or non-linguistic) discourse event, while the interpretation of VPE is more constrained
-

Conclusion

- The differences between VPA and VPE are consistent with the view that there are additional syntactic restrictions on VPE
 - VPE interpretation is not determined solely by the relative salience of the nonlinguistic and linguistic contexts
-
